STATINTL

In my visit with you on 6 December 1961, [REDACTED] requested that we recommend how to best operate the 10, 20, 40X Precision Enlarger on 50 cycle, 220 volts power.

It is proposed that the subject enlarger be equipped with different

- (1) Vacuum pump,
- (2) Fluorescent lamp ballasts, and,
- (3) Exposure time controller (timer).

This will permit the instrument to operate from 50 cycle, 115 volt power. A transformer should be supplied at the point of use to provide 115 volts from the 230 volt line.

We can purchase the necessary parts, install them, and test the operation of a 50 cycle machine as one of the present order of 10 instruments for an additional cost not in excess of 500 to 1000 dollars. We do not expect such an alteration to delay the delivery schedule of two instruments per month, however, we should have about 3 months to procure and schedule the installation of the 50 cycle components.

STATINTL

Will you please convey this information to [REDACTED]

Yours truly,

[REDACTED]

STATINTL
